

STOCAREA SI ACCESUL LA DATE

Pentru stocarea datelor am folosit un server MySQL, iar pentru proiectarea bazei de date am folosit tool-ul MySQL Workbench.

Baza de date este compusa din 5 tabele: 3 tabele cu informatii propriu-zise (pentru ingrediente, pizza, respectiv comenzi) si doua tabele de legatura (o tabela de legatura intre pizza si ingredientele pe care le contine, respectiv o alta pentru stabilirea legaturii dintre o comanda si pizza pe care le contine).

| | Table ▲ | Action | Records ¹ | Type | Collation | Size | Overhead |
|--------------------------|--------------------|---|----------------------|--------|-------------------|-----------|----------|
| <input type="checkbox"/> | ingredients |      | 8 | InnoDB | latin1_swedish_ci | 16.0 KiB | - |
| <input type="checkbox"/> | orders |      | 3 | InnoDB | latin1_swedish_ci | 16.0 KiB | - |
| <input type="checkbox"/> | orders_pizzas |      | 5 | InnoDB | latin1_swedish_ci | 48.0 KiB | - |
| <input type="checkbox"/> | pizzas |      | 4 | InnoDB | latin1_swedish_ci | 16.0 KiB | - |
| <input type="checkbox"/> | pizzas_ingredients |      | 9 | InnoDB | latin1_swedish_ci | 48.0 KiB | - |
| | 5 table(s) | Sum | 29 | MyISAM | latin1_swedish_ci | 144.0 KiB | 0 B |

Tabela "ingredients" contine informatii despre ingrediente. Fiecare ingredient este unic determinat printr-un id.

| | Field | Type | Collation | Attributes | Null | Default |
|--------------------------|-------|-------------|-------------------|------------|------|---------|
| <input type="checkbox"/> | name | varchar(20) | latin1_swedish_ci | | Yes | NULL |
| <input type="checkbox"/> | id | int(11) | | | No | None |
| <input type="checkbox"/> | price | float | | | Yes | NULL |

Tabela "pizzas" contine informatii despre pizza. Fiecare pizza este unic determinata printr-un id.

| | Field | Type | Collation | Attributes | Null | Default |
|--------------------------|-------------|-------------|-------------------|------------|------|---------|
| <input type="checkbox"/> | id | int(11) | | | No | None |
| <input type="checkbox"/> | name | varchar(45) | latin1_swedish_ci | | Yes | NULL |
| <input type="checkbox"/> | description | varchar(45) | latin1_swedish_ci | | Yes | NULL |
| <input type="checkbox"/> | permanent | tinyint(4) | | | Yes | 0 |
| <input type="checkbox"/> | link | varchar(45) | latin1_swedish_ci | | Yes | NULL |
| <input type="checkbox"/> | date | varchar(45) | latin1_swedish_ci | | Yes | NULL |

Tabela de legatura intre o pizza si ingredientele continute se bazeaza pe doua campuri "foreign key": id_pizza legat de id din tabela "pizzas", respectiv id_ingredient legat de id-ul din "ingredients".

| | Field | Type | Collation | Attributes | Null | Default |
|--------------------------|---------------|---------|-----------|------------|------|---------|
| <input type="checkbox"/> | id_pizza | int(11) | | | Yes | NULL |
| <input type="checkbox"/> | id_ingredient | int(11) | | | Yes | NULL |

| Keyname | Type | Unique | Packed | Field |
|-------------------------|-------|--------|--------|---------------|
| fk_pizzas_ingredients_1 | BTREE | No | No | id_pizza |
| fk_pizzas_ingredients_2 | BTREE | No | No | id_ingredient |

Tabela "orders" contine informatii cu privire la comenzi. La fel ca celelalte componente, si o comanda este unic determinata printr-un camp numit "id".

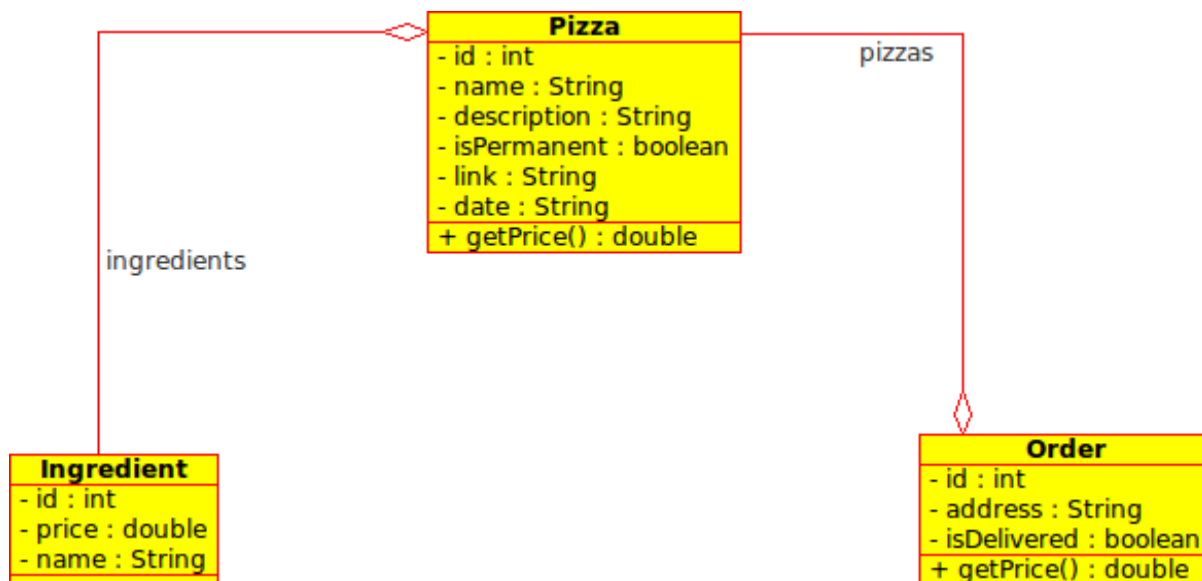

| | Field | Type | Collation | Attributes | Null | Default |
|--------------------------|------------------|-------------|-------------------|------------|------|-------------|
| <input type="checkbox"/> | id | int(11) | | | No | <i>None</i> |
| <input type="checkbox"/> | address | varchar(45) | latin1_swedish_ci | | Yes | <i>NULL</i> |
| <input type="checkbox"/> | delivered | tinyint(4) | | | Yes | 0 |

Legatura dintre comanda si pizza se realizeaza prin tabela "orders_pizzas", la fel ca mai sus.

| | Field | Type | Collation | Attributes | Null | Default |
|--------------------------|-----------------|---------|-----------|------------|------|-------------|
| <input type="checkbox"/> | id_order | int(11) | | | Yes | <i>NULL</i> |
| <input type="checkbox"/> | id_pizza | int(11) | | | Yes | <i>NULL</i> |

| Keyname | Type | Unique | Packed | Field |
|---------------------------|-------|--------|--------|----------|
| fk_orders_pizzas_1 | BTREE | No | No | id_order |
| fk_orders_pizzas_2 | BTREE | No | No | id_pizza |

Obiectele java care se mapeaza pe informatiile din aceste tabele sunt definite prin clasele Ingredient, Pizza si respectiv Order din pachetul client, conform diagramei de mai jos:

Maparea propriu-zisa intre aceste obiecte si baza de date se realizeaza prin Hibernate. Legaturile dintre obiecte se implementeaza prin relatia de tipul "one-to-many". De exemplu, maparea unui obiect de tipul Ingredient la tabela ingredients se face in felul urmator:

```
<class
  name="client.Ingredient"
  table="ingredients">
  <id
    name="id"
    column="id">
    <generator class="increment"/>
  </id>
  <property
    name="name"
    column="name"/>
  <property
    name="price"
    column="price"/>
</class>
```

Ca si exemplu de stabilire a legaturilor dintre obiecte se prezinta Order si Pizza:

```
<class
  name="client.Order"
  table="orders">

  (...)

  <set name="pizzas" table="orders_pizzas">
    <key column="id_order"/>
    <many-to-many column="id_pizza"
      unique="true"
      class="client.Pizza"/>
  </set>
</class>
```
